

Question

Answer

1.) Who is the manufacturer / what is the brand of your wireless product?

2.) Do you have more than one brand of wireless product?

(if more than one brand exists, that means they can't be controlled centrally or perform as team. This will affect clients ability to roam between access points)

3.) Where is your configuration or administration console for your wireless system? Do you have access to it?

4.) How old is your wireless system / when was it last replaced?

(Any system dated more than 3 years is most likely already far behind in wireless technology. There have been major changes in throughput abilities on wireless and the designed client to AP capacity has changed. Antennas have become more intuitive tuning their signal strength to fit specific environments automatically)
