

Perimeter ProtectSM

Delivers a First Line of Defense

Get Your Security Going with an Affordable, Effective, and Easy to Implement Solution

You recognize that security is important, but you have doubts that recent cyberattacks pertain to you. **You want** to protect your technology environment against cybercrime, but you're unsure of the steps you need to take. **You fear** that your team won't be able to manage a security program. **You question** if there's room in your budget for security measures, and if there is, are they worth the investment?

If any of these concerns apply to you, then Perimeter Protect is the first step toward putting your security worries to rest.

PERIMETER PROTECT BENEFITS

- ▲ Affordable
- ▲ Progressive Technology Enriched by Human Insight & Support
- ▲ Early and Advanced Threat Detection & Prevention
- ▲ Ongoing Observation & Rapid Response for Real Peace of Mind
- ▲ Detailed, Digestible, and Understandable Security Reports

You Need to Start Somewhere Begin with Perimeter Protect

Don't wait to take a hit from cybercrime. The perimeter of your network is a major entry point for cybercriminals.

So, why not start your security setup here? Be ahead of heightened risk with Perimeter Protect, a fusion of a next-generation firewall and enhanced security services. Why? Because yesterday's firewalls don't meet today's needs.

PROACTIVE THREAT PROTECTION IS MADE SIMPLE WITH PERIMETER PROTECT

- ▲ Intrusion Prevention System (IPS)
- ▲ Intrusion Detection System (IDS)
- ▲ Advanced Threat Protection (ATP)
- ▲ Threat Feed Monitoring
- ▲ Web Protection Filtering
- ▲ Web Server Protection
- ▲ Application Filtering
- ▲ Email Protection
- ▲ Wireless Protection
- ▲ Enhanced Logging & Reporting
- ▲ Secure VPN Access
- ▲ WAN Failover & Load Balancing

Perimeter Protect - Delivers a First Line of Defense

Security

Where to begin? Perimeter Protect gives you defensive security that couples technology with expertise.

Perimeter Protect presents an extensive set of security offerings from a state-of-the-art hardware and human-experience perspective. This is one of many facets that sets Perimeter Protect apart from other perimeter security options on the market.

With Perimeter Protect, you can expect a wide range of armor for your outer environment, beginning with resistance toward external attacks. Other vital capabilities include real-time inspection of web traffic, safeguarding of email, prevention of data loss, complete Wi-Fi control, and so much more.

Our expert Information Security Advisory Team (ISAT) stays on top of all threats within your system. Through standard monitoring, as well as Threat Feed Monitoring, ISAT gives you critical, timely and relevant information and recommendations to put into play. An original and highly effective solution, Perimeter Protect makes security manageable.

Flexibility

In today's complex world of security, flexibility is the name of the game. Perimeter Protect doesn't hold back.

Perimeter Protect can be deployed as a hardware or virtual appliance, or in the cloud as a hosted appliance for complete flexibility. Its Secure VPN Access offers both Site-to-Site and Remote Access VPN connectivity, making communication seamless between headquarters and branch offices, for example. Other great assets of Perimeter Protect are its ability to support multiple WAN connections, delivering load balancing and failover; and providing

Quality of Service (QoS), guaranteeing more reliable and consistent network throughput. Perimeter Protect works in conjunction with specific security technology for amplified, unmatched defense.

Visibility

Knowing what is happening on your network shouldn't be a mystery. Perimeter Protect brings clarity to Logging & Reporting.

Perimeter Protect offers exceptional logging and reporting capabilities that can provide out-of-the-box, automated report generation and distribution for a variety of reports covering all features of the Perimeter Protect competencies. What's unique is that these reports are designed with you in mind. Not only do they present just the right amount of detail, but they are also easy to navigate and understand, letting you spend little time deciphering their meaning and more time taking care of security.

FEATURES

- ▲ Monthly Subscription
- ▲ Hardware + Services
- ▲ Prime Security Functionality
- ▲ Active Security Management & Monitoring
- ▲ Standardized Monthly Reporting

A Closer Look Inside Perimeter Protect

Shield Your Environment from External Attacks with an Intrusion Prevention System (IPS) & Intrusion Detection System (IDS)

The Intrusion Prevention System (IPS) & Intrusion Detection System (IDS) continuously monitor your network for malicious activity or violations, and block external attacks from happening. Select only the IPS rules that apply to you or create custom criteria to fit your exact needs.

Prevent and Detect Threats and Infections Inside or Outside of Your Network with Advanced Threat Protection (ATP)

Advanced Threat Protection (ATP) combines multiple types of security features, working fluidly together, to prevent and detect threats and infections inside and outside of your network. The types of attacks it monitors include Advanced Persistent Threats (APTs) – malicious attacks from a foreign country; command and control traffic to reveal threats like botnets, which can participate in denial-of-service attacks, for instance; and targeted assaults.

Proactively Monitor Threats with Threat Feed Monitoring

Our Information Security Advisory Team (ISAT) brings experts into the equation. They monitor and review alerts generated by the customer's system, and present recommendations for swift action. As well, ISAT has its finger on the pulse of the latest threat intelligence and shares this

knowledge. Threat Feed Monitoring is an essential part of any security strategy.

Safeguard Web Activity with Web Protection Filtering & Web Server Protection

Web Protection Filtering allows organizations to control information accessible via the Web through a set of rules defined by you. Perimeter Protect features customizable URL filtering policies to block access to sites based on category or content type, and can be set to work with quotas, specific users or groups, or by time of day. Moreover, blacklisting and whitelisting for specific sites and services allow for necessary exceptions. Web Server Protection stands up to malware, offering real-time inspection of all web traffic and downloads.

Safely Enable Applications with Application Filtering

To safely enable applications, it's important to group them based on properties that you define, such as category and technology. Set your rules, and let Application Filtering do the rest, enabling you to provide access to applications while eliminating the need to keep updating the rules of your Application Filtering policy.

Our Information Security Advisory Team (ISAT) has its finger on the pulse of the latest threat intelligence and shares this knowledge with you.

A Closer Look Inside Perimeter Protect

Guard Incoming and Outgoing Email with Email Protection

Phishing emails are a form of social engineering and are designed primarily to acquire sensitive data for financial gain or further access into a network. They are also a mechanism for delivering malware – software that aims to harm or disable computers and computer systems. The Perimeter Protect Email Protection function watches over all email passing in and out of your network, detecting and stopping malicious and spam emails from hitting your Inbox. In addition, it offers email encryption, and blocking or notification based on the type of data being transferred through an email message. This prevents the sharing of sensitive information in an unsecured fashion. An Outlook add-in feature is available with the encryption features, and users can take advantage of the self-service portal for quarantine management and email-sender whitelist controls.

Strengthen Wireless Connections with Wireless Protection

Where there is wireless, there can be weakness. Not with Perimeter Protect. It serves as a Wi-Fi controller for access points that are easily deployed across your network. Access points that are sized for different numbers of connections are plug and play to position, once wireless network information is configured on the Perimeter Protect device. By using multiple Wi-Fi zones, guest networks and hotspots, combined with Network Access Control (NAC), a high level of security, flexibility, and accessibility is achieved.

Get Clear Security Intelligence with Enhanced Logging & Reporting

Designed with you in mind, Perimeter Protect delivers automated reports that you can navigate with ease, covering

all aspects of the solution. Combined with Active Directory or Single Sign-On (SSO), the reports can help pinpoint computers, departments, and users that are generating excessive network traffic or accessing sites that violate company-approved user policies. You're in control now.

Be Remote with Secure VPN Access

If you have branch offices, then Perimeter Protect is a must. Its Site-to-Site and Remote Access VPN connectivity are essential in the modern workplace. Our services simplify deployment of VPN tunnels, and VPN connectivity is realized by using the latest industry standard technologies. VPN connectivity is also available via the HTML5 self-help portal for secure network access.

Stay Up and Running with WAN Failover & Load Balancing

When the Wide Area Network (WAN) wobbles, your business won't with WAN Failover & Load Balancing. Together, they stop your network from costly disruptions. Able to handle multiple WAN connections, Perimeter Protect provides load balancing, failover and Quality of Service (QoS) with these connections. And, block, shape or throttle traffic to specific applications with defined preferences.

Individual sites and technical environments may have an impact on service offerings.

Start your security off right with Perimeter Protect.
